

Digitization Guide — Photo & Screenshot Assignment

UC Davis Digitization Lab

Hi Lenci and Cassie,

I'm out today, but I have an assignment for you: I'm building out our Digitization Guide and need photos of our lab and fresh screenshots of the software. You don't need to put anything into the guide itself — just take the shots, name them as listed, and put them all in the **Guide Photos** folder described at the bottom. I'll place them into the guide later.

Part 1 — Phone photos of the equipment

jpg is fine, landscape, room lights on, get close enough that the subject fills the frame:

1. **equipment-versa-station** — the whole DT Versa station in one shot: camera column, glass platen, and both lights
2. **equipment-v-cradle-versa** — set up the **V-Cradle on the Versa** for real: put the cover on the Versa and get the camera at the correct angle and height for **600 ppi**. Then photograph the whole setup so the cradle, cover, and camera angle are all visible.
3. **equipment-v-cradle-volume** — with that same setup, a closer shot of the V-Cradle with a bound volume open in it
4. **equipment-film-light-table** — set up the **film scanning light table and its cover** on the Versa and photograph the setup. *If you don't really remember how this goes together, skip it — no guessing with the equipment.*
5. **handling-gloves-cradle** — someone (gloved) handling a volume with the book cradle/wedge in use

Part 2 — Run the full preflight and screenshot as you go

Follow **General Preflight** in the guide top to bottom (PPI & Focus → Mode, Profile & Curve → LCC → White Balance → Exposure → Finalize). Do it for real, and at each step screenshot the relevant Capture One panel. This is also your chance to learn the preflight cold — by the end you should be able to do it without the guide open.

Mac screenshot tips: **Cmd + Shift + 4** drag to capture a region; **Cmd + Shift + 4, then Space** to capture a whole window cleanly. Keep the default PNG.

Name each shot for the step it shows (these match the guide's filenames):

- **preflight-phase-one-power-box** — phone photo: the power box with its light green
- **preflight-versa-pedals-light-control** — phone photo: foot pedals + light-control box
- **preflight-target-on-platen** — phone photo: color target centered under the glass
- **preflight-set-capture-folder** — Session Favorites → Preflight folder → Set as Capture Folder
- **preflight-live-view-icon** — the Live View icon in the toolbar
- **preflight-camera-focus-400ppi** — Camera Focus tool set to 400 ppi
- **preflight-focus-meter-pick-area** — picking the focus meter area in Live View

- [preflight-base-characteristics](#) — Base Characteristics with Mode, ICC Profile, and Curve set for flat art
- [preflight-create-lcc](#) — the LCC frame (even gray edge-to-edge) with the Create LCC dialog
- [preflight-white-balance-dropper](#) and [preflight-white-balance-patch](#) — the WB dropper and the neutral patch you sampled
- [preflight-add-color-readout](#) and [preflight-color-readouts-placed](#) — adding readouts and readouts placed on the mid-tone patches
- [preflight-exposure-slider](#) — the Exposure adjustment
- [preflight-curve-linear-response](#) — Curve switched to Linear Response
- [preflight-set-capture-folder-library](#) — capture folder set back to the item folder
- [preflight-reset-capture-counter](#) — Next Capture Naming → Reset Capture Counter

Getting everything onto the work Mac

1. On the work Mac, open **Finder** → **Pictures** and make a folder called **Guide Photos** (if someone hasn't already).
2. AirDrop your phone photos over: on the Mac, open **Finder** → **AirDrop** (sidebar) and set "Allow me to be discovered by" to **Everyone** at the bottom. On your iPhone, select your photos in the Photos app → **Share** (square-with-arrow) → **AirDrop** → tap the Mac's name. (If the Mac doesn't appear, make sure its Wi-Fi and Bluetooth are on.)
3. AirDropped photos land in the Mac's **Downloads** folder — move them into **Pictures** → **Guide Photos**, and rename each file there to its name from the list (click the file, press **Return**, type the name).
4. Save/move your screenshots into the same **Guide Photos** folder with their list names. (Screenshots save to the Desktop by default.)
5. When you're done, set AirDrop back to "Contacts Only."

If a step doesn't look like the guide describes, screenshot it anyway and note what was different — that's exactly what I want to find out. Questions → post them in the thread and help each other first; I'll check in when I'm back.

Thanks!
